COMPANY

Overview

ValveHut offers an accomplish **valve refurbishment service** with an emphasis on quick turnaround. We are fully aware that valves are key assets in your business, ensuring they work correctly is central to keeping your entire process flowing freely.

Valves replacement can be costly, which is why it is important to entrust your valves to a company with expertise and comprehensive facility for valve repair and refurbishment. **Valve refurbishment** can also improve both safety and efficiency, save money by stopping leakages.

We expertly refurbish all types and makes of valves. This work is carried out by skilled personnel at our dedicated workshop or at site. Every item is fully inspected at every stage and it is then tested before we return it to you.

Valve failures have the potential to adversely impact plant operations potentially leading to unscheduled shutdowns, lost power generation, and refueling outage extensions. As opposed to maintenance activities, valve repairs generally require some degree of welding and machining resulting in significant cost and time duration required to perform these repairs.

We don't only provide valve repair activities but guidance and support for gate, globe, and check valve repair practices beyond those typically recognized as maintenance on how to remove defects and restore those materials by welding and machining.

OUR Strength

ValveHut repairs and refurbish almost any size, type and make of valve, in - situ, in shop and on budget. Our team of Engineers and Technicians who have many years of valve service experience, to undertake repair and overhauling of various types of valves.
